Antigravity Extensions, Plugins, Skills & MCP Setup

Use this to configure Antigravity as the permanent project commander.

1. Control Principle

Antigravity remains Project Commander, Lead Architect, Reviewer, Integration Lead and QA Coordinator. The implementation worker is replaceable.

Use only necessary integrations. Keep permissions narrow and prefer review/confirmation for commands.

2. Workspace Skills

```
ai-agent-trading/
■■■ .agents/
■■■ skills/
■ ■■■ trading-safety-review/SKILL.md
■ ■■■ implementation-task/SKILL.md
■ ■■■ test-and-verify/SKILL.md
■ ■■■ github-release/SKILL.md
■ ■■■ deployment-review/SKILL.md
■ ■■■ architecture-review/SKILL.md
■■■ rules/
■ ■■■ trading-safety.md
■ ■■■ one-writer-rule.md
■ ■■■ architecture-boundaries.md
■■■ agents/
```

Create these only after inspecting existing project controls. Avoid duplicate or conflicting instructions.

3. Skill Responsibilities

trading-safety-review: deterministic risk ownership, emergency exits, broker reconciliation and no-LLM safety-critical dependencies.

implementation-task: bounded scope, existing-pattern reuse, tests, minimal diffs and no unrelated edits.

test-and-verify: run relevant tests, record evidence and never declare success without verification.

github-release: secret scan, status, documentation, changelog, tag and reproducibility checks.

deployment-review: environment variables, dependencies, persistence, health checks and free-tier constraints.

architecture-review: compare changes with ARCHITECTURE.md, API contracts, schema and trading rules.

4. MCP & Plugins

Antigravity supports plugins containing skills, agents, rules, MCP servers and hooks. It supports MCP for developer tools, databases, parsers and APIs.

Add MCP only for a concrete need. Prefer read-oriented integrations first. Never give broad destructive permissions without explicit approval.

After each installation, verify the exact server, tools, permissions and failure behavior.

5. IDE Extensions

Antigravity has official IDE extension support for VS Code, Visual Studio, JetBrains, Zed and Xcode. Install only extensions needed for this project.

Do not assume an IDE extension automatically becomes a subordinate agent. Prefer supported Antigravity agents, plugins, skills, MCP or CLI workflows.

6. STOP

After configuration, report exactly what was installed, where it lives, permissions, and how it will be used. Stop.
