Implementation-Agent Migration: Cline / Kilo Code

Use after V1 release. Antigravity stays commander; Cline/Kilo becomes bounded implementation worker.

1. New Operating Model

```
USER
↓
ANTIGRAVITY = Commander / Architect / Reviewer / QA
↓
CLINE or KILO = bounded implementation worker
↓
Git diff + tests
↓
ANTIGRAVITY review
↓
USER approval
```

Never allow two implementation agents to write to the same working tree concurrently.

2. Evaluation

Test both agents on the same small, non-safety-critical task in separate clean branches/worktrees. Compare repository comprehension, architecture adherence, minimal diff, tests, error handling, documentation, CLI reliability, permissions, MCP support and ease of Antigravity orchestration.

Do not declare a winner before evidence is collected. Save the evaluation under docs/agent-evaluation/.

3. Cline Prompt

```
You are the bounded implementation worker for ai-agent-trading.
Antigravity is the project commander and final reviewer.
Read the project control documents before editing.
Implement ONLY the assigned task.
Do not change architecture, trading safety rules, broker behavior, capital limits, or unrelated
files.
Run relevant tests.
Report files changed, tests, failures, assumptions and risks.
Do not place real trades or connect to a live broker.
Stop after the task.
```

4. Kilo Prompt

```
You are the bounded implementation worker for ai-agent-trading.
Antigravity is the project commander and final reviewer.
Read project controls and Kilo rules before editing.
Implement ONLY the assigned task using the smallest safe diff.
Run relevant tests.
Do not modify safety-critical behavior unless explicitly authorized.
Report files changed, tests, failures, assumptions and risks.
Never place real orders.
Stop after the task.
```

5. Antigravity Delegation Prompt

```
From now on, treat the external implementation agent as a replaceable worker.
You remain Project Commander, Lead Architect, Reviewer, Integration Lead and QA Coordinator.
Before delegation: inspect repository, define exact files and bounded scope.
Delegate one writer at a time.
After implementation: inspect git diff, run tests, review architecture and safety implications,
then request targeted corrections if needed.
Do not start another task until the current task passes review.
Never delegate live trading or safety-critical release actions without explicit user approval.
```

6. Kilo Setup Check

```
npm install -g @kilocode/cli
kilo --version
```

Verify the installed version and current official Kilo documentation before executing setup; commands can change.

Prefer CLI/plugin/MCP orchestration over UI automation. If direct Antigravity-to-agent orchestration is unsupported, keep the worker separate and have Antigravity review Git diffs.

7. STOP

After evaluating both agents, present evidence and wait for the user's selection. Do not migrate the whole project automatically.
