Phase 25+ Control Prompts

Post-V1 extension framework. Execute sequentially; stop at every checkpoint.

Global Rule

```
YOU = Final Authority
ANTIGRAVITY = Commander / Architect / Reviewer / QA
IMPLEMENTATION AGENT = bounded worker
QWEN3 + DEEPSEEK-R1 = runtime trading AI
ONE WRITER AT A TIME.
NO LIVE TRADING DURING DEVELOPMENT.
NO NEXT PHASE WITHOUT CHECKPOINT.
```

Phase 25 — Production Operations

Health checks, data-feed health, broker connectivity status, database health, latency/error monitoring, backups and operational runbooks.

```
APPROVE PHASE 25.
Execute only Phase 25.
Use the approved implementation agent.
Review diffs and run verification.
Do not start Phase 26.
Stop at checkpoint.
```

Phase 26 — Live Trading Stabilization

Only after explicit user approval: compare paper/live execution, slippage, costs, rejected orders, partial fills, reconciliation and Position Watcher behavior. Do not increase capital automatically.

```
APPROVE PHASE 26.
Use observed evidence only.
Do not alter risk limits or capital limits without explicit approval.
Stop at checkpoint.
```

Phase 27 — Strategy Research & Optimization

Version experiments; use realistic costs/slippage, leakage/look-ahead checks, walk-forward validation where appropriate and paper validation. Preserve old versions.

```
APPROVE PHASE 27.
Research in isolated branch/worktree.
No experiment enters production silently.
Stop at checkpoint.
```

Phase 28 — AI Learning & Evaluation

Measure Qwen3 thesis quality, DeepSeek-R1 challenge behavior, disagreement, gate rejection, latency, timeouts and outcomes. Version prompts/configuration. AI cannot override deterministic safety controls.

Phase 29 — Controlled Capital Scaling

Introduce configurable capital stages only after validation and explicit approval. Require rollback and reconciliation. Never scale automatically from recent performance.

Phase 30 — Advanced Market Intelligence

Research regime detection, sector context, volatility regime, breadth and other validated features. Every addition gets leakage/look-ahead review and backtesting.

Phase 31 — Multi-Strategy Portfolio

Add strategy allocation only after independent validation. Deterministic portfolio risk controls exposure and concentration.

Phase 32 — Execution Optimization

Study slippage, fills, order timing, liquidity-aware sizing, transaction costs and latency. Validate with paper execution first.

Phase 33 — Disaster Recovery

Test crash/restart, broker disconnect, stale data, database failure, duplicate-order prevention, state reconstruction and safe resume.

Phase 34 — Security Hardening

Audit secrets, authentication, authorization, dependencies, network exposure, audit logs, configuration integrity and broker permissions. Never commit secrets.

Phase 35 — Research Sandbox

Keep experiments isolated from production with reproducible datasets, versioned code/configuration and explicit promotion.

Phase 36 — AI Council Evolution

Add models only when there is measurable justification. Keep deterministic Trade Gate and Position Watcher independent of model availability.

Phase 37 — Long-Term Autonomous System

Only after earlier phases are validated, consider broader automation and strategy portfolio management. Continue explicit release gates and human approval.

Checkpoint Requirement

```
Every phase output:
1. Plan
2. Bounded tasks
3. Agent assignments
4. Diffs
5. Tests
6. Verification evidence
7. Known issues
8. Checkpoint status
9. STOP
```
