V1 Release, GitHub & Documentation Control Prompt

Upload after Phase 24. Antigravity owns execution; stop before Phase 25.

1. V1 Freeze

Audit the complete repository. Run all tests. Verify trading safety, deterministic risk controls, Position Watcher, persistence, restart/reconciliation, broker abstraction, configuration and secret handling.

Do not silently alter trading behavior. Record material defects or architecture conflicts and request user approval before changing them.

2. GitHub Release

Prepare the ai-agent-trading repository for a clean V1 release. Never commit API keys, broker credentials, tokens, secrets, private local data or generated secret files.

```
git status
git add -A
git commit -m "release: ai-agent-trading v1.0.0"
git tag -a v1.0.0 -m "ai-agent-trading V1.0.0"
git push origin main
git push origin v1.0.0
```

Use the actual branch/remote discovered in the repository; do not blindly run commands that conflict with the existing setup.

3. Documentation Deliverables

```
README.md
LICENSE
SECURITY.md
CONTRIBUTING.md
CHANGELOG.md
docs/architecture/
docs/workflows/
docs/deployment/
docs/development/
docs/testing/
docs/operations/
docs/trading/
docs/ai/
docs/troubleshooting/
```

README must explain: concept, architecture, end-to-end flow, BUY engine, SELL engine, Position Watcher, AI Council, deterministic Trade Gate, capital/risk/cost engine, execution states, backtesting, paper trading, dashboard, installation, configuration, tests, deployment, limitations and safety.

Create a detailed workflow document and free/low-cost deployment document. Clearly state free-tier limitations and that safety-critical live trading should not depend on an unreliable sleeping/free service.

4. Reproducibility Gate

Verify a clean clone can install dependencies, run tests and launch the application using documented steps. Record commands, prerequisites and expected results.

Create a V1 release report with commit/tag, tests, known issues, environment requirements, deployment status, security review and deferred items.

5. STOP

Do not begin Phase 25. Present the release report and wait for explicit user approval.
