UI/UX Specification + Cline/Kilo UI Agent Evaluation — ai-agent-trading

Final UI/design control document. Includes a controlled Cline vs Kilo Code benchmark specifically for UI development.

1. Goal

Finalize the existing functional product as a premium futuristic trading terminal without changing trading, risk, AI, database, broker or API behavior.

2. Locked Design

Dark space/galaxy atmosphere; subtle Earth/space presence; premium glassmorphism; thin luminous borders; controlled cyan/blue/violet accents; clean modern typography; professional, minimal space-tech aesthetic. Trading information is always the visual priority.

3. Hard Rules

Do not modify trading calculations, strategies, risk limits, Trade Gate, Position Watcher, broker adapters, database contracts or AI decision logic for UI purposes. Do not connect a live broker or place real orders during UI work. Do not fabricate market data, P/L, AI decisions, order states or health metrics. ONE WRITER AT A TIME.

4. Dashboard Architecture

Global status → Portfolio/Capital + Live Market Chart + AI Council → AI Trade Activity → Deterministic Trade Gate + Position Watcher → Orders/Execution + System Health. Keep current market state, positions, orders and decisions easy to reach.

5. Key UI States

Clearly distinguish AI PROPOSED BUY, AI PROPOSED SELL, WATCHING, ORDER SUBMITTED, PARTIALLY FILLED, FILLED, CANCELLED and REJECTED where supported. Never visually equate an AI proposal with an executed order.

6. AI Council

Qwen3: thesis/evidence. DeepSeek-R1: challenge/contradictions/risk/invalidation. Deterministic Trade Gate: actual checks/final decision. Model loading, timeout and error states must be truthful.

7. Market / Risk / Execution

Market chart shows symbol, timeframe, price/context, status and data freshness. Portfolio shows total/available/deployed capital and realized/unrealized P/L where supported. Position Watcher remains persistently visible. Orders show truthful lifecycle CREATED → SUBMITTED → ACKNOWLEDGED → PARTIALLY_FILLED → FILLED/CANCELLED/REJECTED.

8. Visual System

Deep near-black surfaces; controlled cyan/blue primary accents; restrained violet secondary accent; semantic states with text/icons; moderate glass transparency; subtle blur; thin borders; highly legible typography; consistent spacing; readable/tabular trading numbers.

9. Animation / Responsive / Accessibility

Use motion only for real activity: live chart updates, data pulse, AI processing, order transitions and status indicators. Respect reduced motion. Desktop is primary; smaller screens prioritize positions, alerts, orders, health and active decisions. Maintain contrast, keyboard access and semantic labels.

10. Implementation Order

UI audit → design proposal → approval → design tokens/theme → shell → dashboard → chart → Trade Activity → AI Council → Trade Gate/Watcher → portfolio/risk/orders → loading/error/stale states → animation → responsive/accessibility → browser QA → acceptance.

11. Cline vs Kilo — Required Evaluation

Before assigning the full UI to one agent, Antigravity MUST test both Cline and Kilo Code on the same small, non-safety-critical UI benchmark. Use isolated branches/worktrees. Do not select based on reputation or generic comparisons; select based on actual rendered UI, code and verification evidence from this repository.

12. Benchmark Task

```
BENCHMARK — redesign ONE existing non-critical dashboard component according to this PDF. Inspect existing patterns first. Reuse existing design system/dependencies. Do not change backend/API contracts. Do not touch trade_gate.py, position_watcher.py, broker adapters, risk/capital logic or strategies. Do not add fake production data. Run relevant UI tests/build/lint/type checks. Report files, dependencies, tests, UX decisions, responsive behavior and remaining issues. STOP.
```

13. Cline Prompt

```
You are the bounded UI implementation worker for ai-agent-trading. Antigravity is Project Commander and final reviewer. Read project rules and the UI/UX PDF. Implement ONLY the assigned benchmark. Prioritize visual quality, specification fidelity, existing-pattern reuse, responsive behavior, accessibility, minimal diff and verification. Do not modify trading logic, Trade Gate, Position Watcher, broker adapters, risk/capital logic, strategies or API contracts. Do not place real orders or add fake data. Run relevant checks. Report files, dependencies, tests, visual decisions and remaining issues. STOP.
```

14. Kilo Code Prompt

```
You are the bounded UI implementation worker for ai-agent-trading. Antigravity is Project Commander and final reviewer. Read project rules and the UI/UX PDF. Implement ONLY the assigned benchmark. Prioritize visual quality, specification fidelity, existing-pattern reuse, responsive behavior, accessibility, minimal diff and verification. Do not modify trading logic, Trade Gate, Position Watcher, broker adapters, risk/capital logic, strategies or API contracts. Do not place real orders or add fake data. Run relevant checks. Report files, dependencies, tests, visual decisions and remaining issues. STOP.
```

15. Antigravity Benchmark Procedure

```
STEP 1: create isolated Cline and Kilo branches/worktrees.
STEP 2: give Cline exactly the benchmark.
STEP 3: capture diff, tests and rendered UI.
STEP 4: restore clean baseline.
STEP 5: give Kilo exactly the same benchmark.
STEP 6: capture diff, tests and rendered UI.
STEP 7: compare both against the same baseline/specification.
STEP 8: inspect the rendered result in the browser.
STEP 9: produce an evidence report.
STEP 10: STOP and wait for the user's selection.
Never allow one agent to reuse the other agent's implementation.
```

16. Evaluation Criteria

Evaluate: UI fidelity; visual hierarchy; component quality; responsive behavior; accessibility; existing-pattern reuse; code quality; minimal diff; tests; state/error handling; dependency discipline; browser rendering; documentation; CLI reliability; permissions; and ease of Antigravity review/orchestration.

17. Selection Rule

After both benchmark implementations are reviewed, Antigravity must present a side-by-side evidence report and wait for the user's decision. If one demonstrates stronger UI quality/workflow suitability, show the evidence. Do not silently migrate the whole project. After user approval, use the selected agent for remaining UI work.

18. Antigravity Orchestration

```
Antigravity remains Project Commander, Lead Architect, Reviewer, Integration Lead and QA Coordinator. It defines bounded tasks, delegates one writer at a time, reviews every diff, runs tests/build/browser verification, checks visual fidelity and requests targeted fixes. The external implementation agent is replaceable.
```

19. Final Acceptance

Premium futuristic direction achieved; trading data is primary; AI proposals differ from execution; Qwen3/DeepSeek-R1/Gate are separated; Position Watcher visible; data freshness clear; order lifecycle truthful; loading/error/stale states present; restrained animation; responsive/accessibility verified; no backend trading behavior changed; no fake data; browser QA complete.

20. STOP

After UI completion, produce a completion report with files, components, dependencies, tests, browser verification, known issues and remaining polish. Do not begin unrelated trading/strategy/cloud/broker work until the user approves the UI.
